

Install and Configure Apache Web Server

Apache http server

The Apache HTTP Server or simply Apache, is free and open-source cross-platform web server software developed and maintained by Apache Software Foundation.

Apache is a easy to learn and configure web server providing an ability to host websites mainly via HTTP or HTTPS protocols. Under RHEL 8 / CentOS 8 system Apache webserver is know under name httpd.

It use following port number and service:

http = 80

https = 443

Install package

```
# yum install http* -y
```

Start & enable Apache webserver

```
# systemctl enable httpd  
# systemctl start httpd
```

Firewall Setup

```
#firewall-cmd --permanent --add-service=http  
#firewall-cmd --reload
```

Insert your website files

By default the Apache web server will greet you with a default welcome page. To disable the default Apache welcome page insert your **index.html** into **/var/www/html/** directory

Access your website

To access your new sample website navigate your client web browser to either

`http://192.168.1.10`

Create configuration file

```
#cd /etc/httpd/conf.d/
```

```
#vim server1.conf
```

```
<VirtualHost *:80>
```

```
ServerAdmin root@server1.example.com
```

```
ServerName server1.example.com
```

```
DocumentRoot /var/www/html
```

```
</VirtualHost>
```

```
<Directory "/var/www/html">
```

```
<RequireAll>
```

```
Require all granted
```

```
</RequireAll>
```

```
</Directory>
```

```
wq
```

```
systemctl restart httpd
```

Add web page

```
#mkdir /var/www/html/owndir
#restorecon -Rv /var/www/html
#cd /var/www/html/owndir

#vim /etc/httpd/conf.d/server1.conf
(Add this)
<Directory "/var/www/html/owndir">
<RequireAll>
Require all granted
</RequireAll>
</Directory>
wq

#systemctl restart httpd
```

Access website page

To access your new sample website navigate your client web browser to either

<http://192.168.1.10/owndir>
